A: As it turns out,. had no idea what kind of program it was, and the "don't install it" option looked much easier to accept. I did however upgrade to the latest version of Java because for some reason I can never remember to do it if I've already done it. In line with wide-spread use of high speed mobile communication devices in recent years, the miniaturization, the thinning, and the weight-reduction of mobile communication devices such as cellular telephones, communication data terminals, personal digital assistants, notebook PCs, PDA, and cameras, and the like are advancing. In electronic devices that include a camera, on the other hand, a number of photographic elements, e.g., an image sensor and the like, are used. As materials used in electronic devices, metal materials are widely employed. Recently, however, plastics are also employed, since plastics do not have the drawbacks of metals such as warping or the like. In particular, when plastic materials are used, the weight of a device can be reduced while the electrical and electromagnetic performances thereof can be improved, and further, an increase in freedom of device design can be expected. In order to manufacture a plastic-packaged electronic device, a plastic used as a material therefor must be compatible with a resin compound, which functions as a material for forming a package, while maintaining the characteristics inherent to the plastic. For example, the plastic must have heat resistance and mechanical properties that are capable of enduring the resin for a long time when the resin is heat-treated at a temperature of 180° C. or higher. In addition, the plastic must have sufficient impact resistance that can endure the shock and vibration involved with carrying a mobile communication device. Further, the plastic must have sufficient dimensional stability that can endure changes in the surrounding humidity or the like. When a plastic-packaged electronic device is manufactured, the plastic material must also be capable of sealingly encasing a package structure, which includes a number of components such as a microprocessor, a memory chip, an electronic part, a fixing member, and the like. Further, to improve the efficiency of device assembly processes, a greater number of components must be accommodated within a limited package space, which has a small dimension with respect to the size of a plastic package. In addition, to ensure water resistance of a plastic molded product, an anti-fog layer for reducing reflection of light from a surface of the plastic molded product f678ea9f9e
